

**INTRODUCTION SESSION 2**  
**“COLLABORATIVE WATER DATA MANAGEMENT  
 FOR KNOWLEDGE DEVELOPMENT “**

Regional exchange on  
 IWRM experiences in the  
 Mekong River Basin  
 15-16-17 October 2014  
 Vientiane, Lao PDR

---

Paul HAENER  
 International Office for Water  
 FRANCE  
[p.haener@oieau.fr](mailto:p.haener@oieau.fr)

## Program of the session

---

<b>09:00 – 09:15</b>	<b>Welcome / Introduction to the session (facilitator)</b>
<b>09:15 – 10:45</b>	<b>Study cases presentations on data management</b>
	Laos
	Cambodia
	Vietnam
	China
	Myanmar ?
	Mekong River Commission
<b>10:45 – 11:00</b>	<i>Coffee break</i>
<b>11:00 – 12:00</b>	Presentation of other international examples
	Exchange, synthesis and recommendations of good practices adapted to the regional context (open discussion)
	Validation/ amendment of the <b>key messages</b> for the next World Water Forum
<b>12:00 – 12:15</b>	Wrap up and close ( <b>around a glass of French wine :)</b>

## Generalities and main concepts related to water data management

3

Vientiane, October 2014

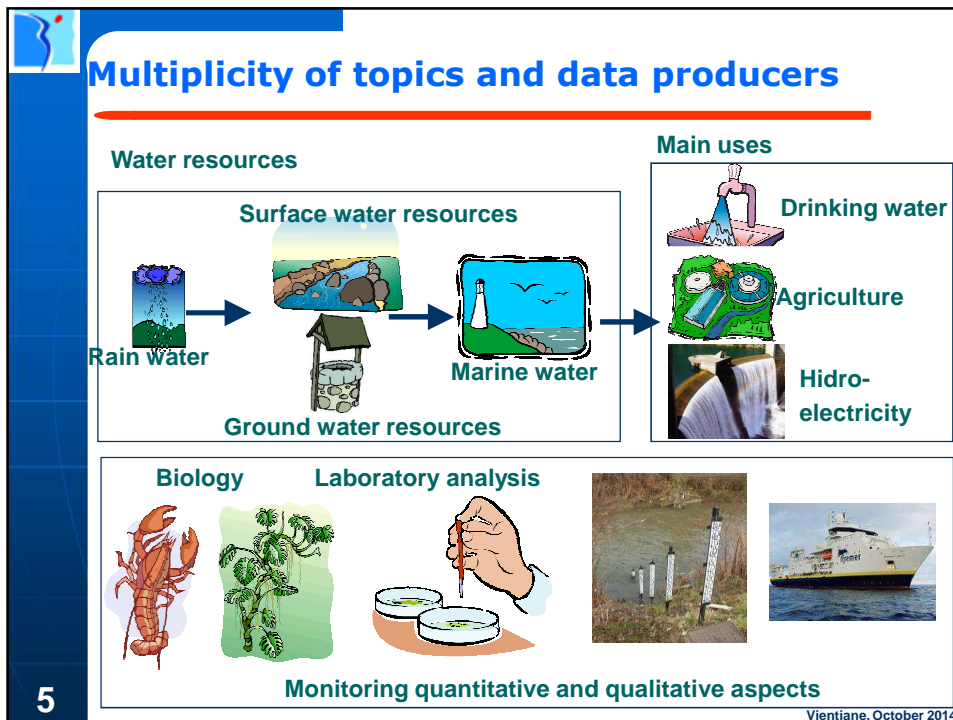

---

### Needs for data/information/knowledge

- Efficient IWRM requires to develop the production of **information necessary to better guide water resource management decision making** for planning, assessing the impact of development project, earmarked charges, ...
- **Various levels of water management with various roles**
  - National water resource planning
  - Basin Water resource planning
  - Local operational management (Province, district, municipal level, dams operation, ...)
  - Transboundary water management basins (Mekong)
- **Different users of information with different needs in information for decision taking**
  - each one requires reliable, up-to-date and relevant information on different issues (regulations, planning, risk management and public information...)
  - Type of information to produce are different : level of aggregation, way of processing, giving access, presenting and are different
  - Type of necessary basic data are different

4

Vientiane, October 2014

- ## Existing situation related to data management
- Many topics to deal with in the basin (hydropower, irrigation, mining, water supply and sanitation, flood management, ...)
  - The data to elaborate necessary information is produced/managed by various organizations
  - Information is **fragmented, incomplete, dispersed and heterogeneous** way
- => need efforts to rationalize and make this information readable, easily accessible and available in order to produce useful information**
- 6
- Vientiane, October 2014

## Consequences of lack of easy access to data

---

Vientiane, October 2014

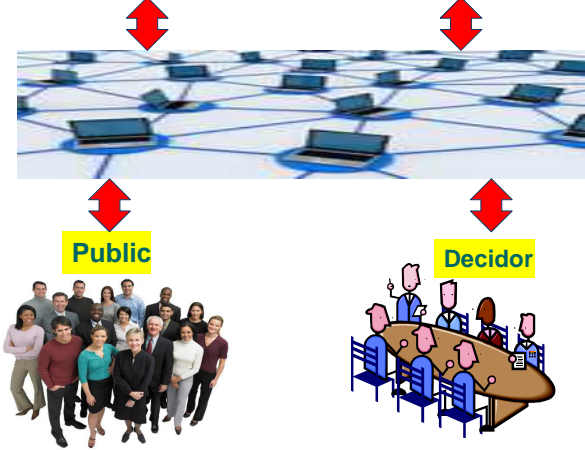

7

## Developing networks of data exchange between actors

---

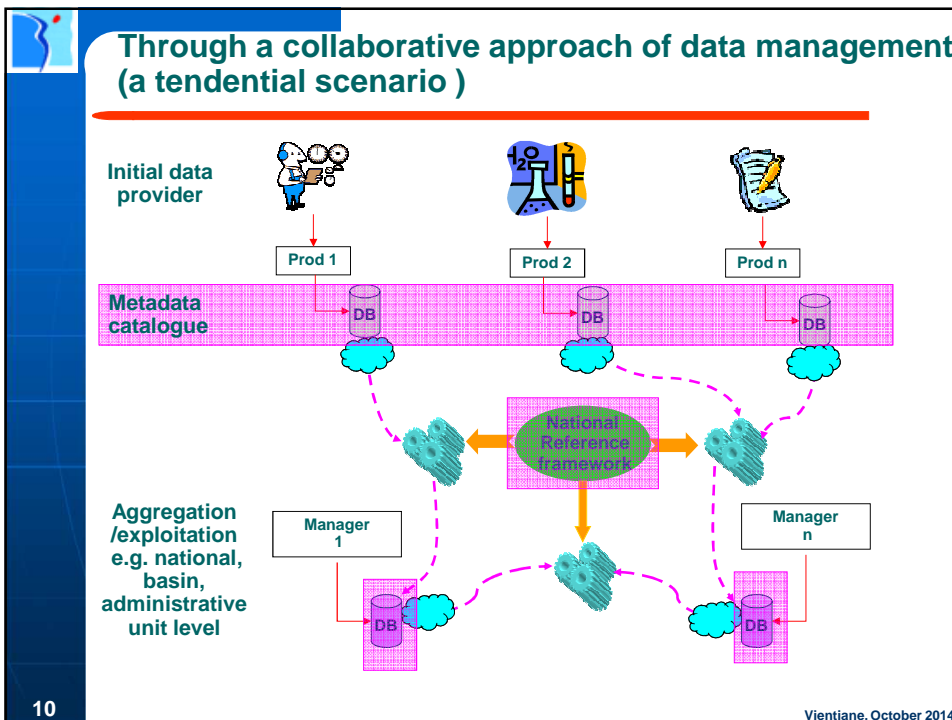

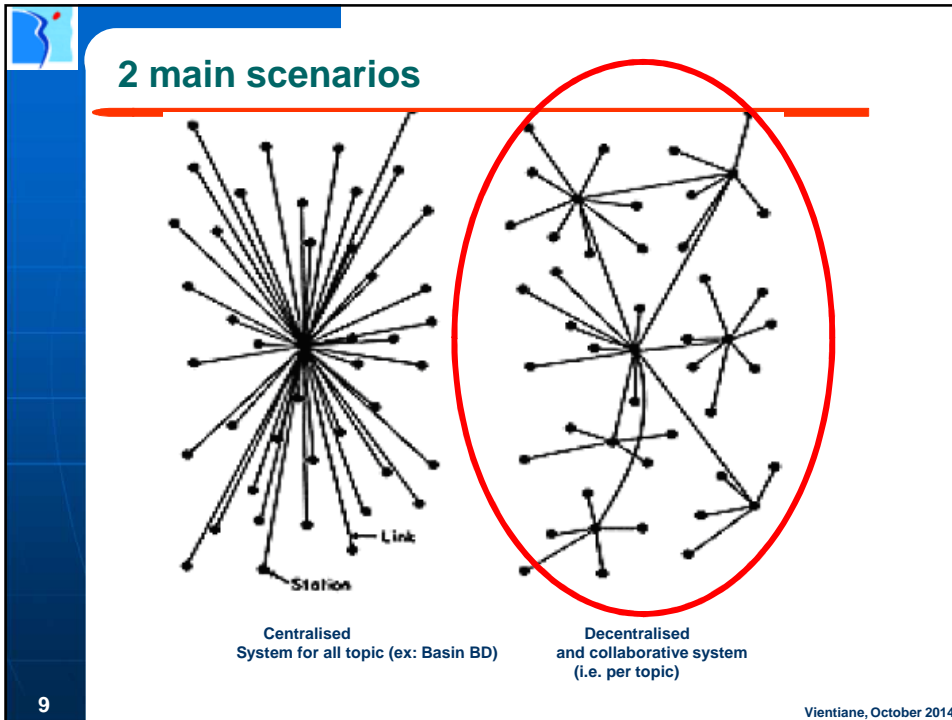

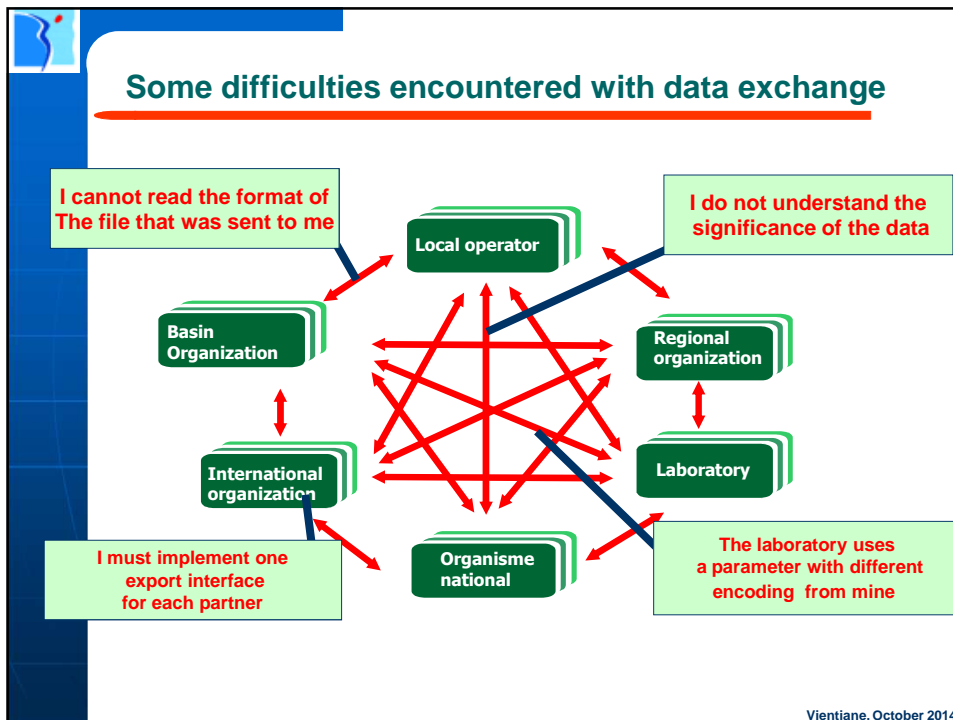

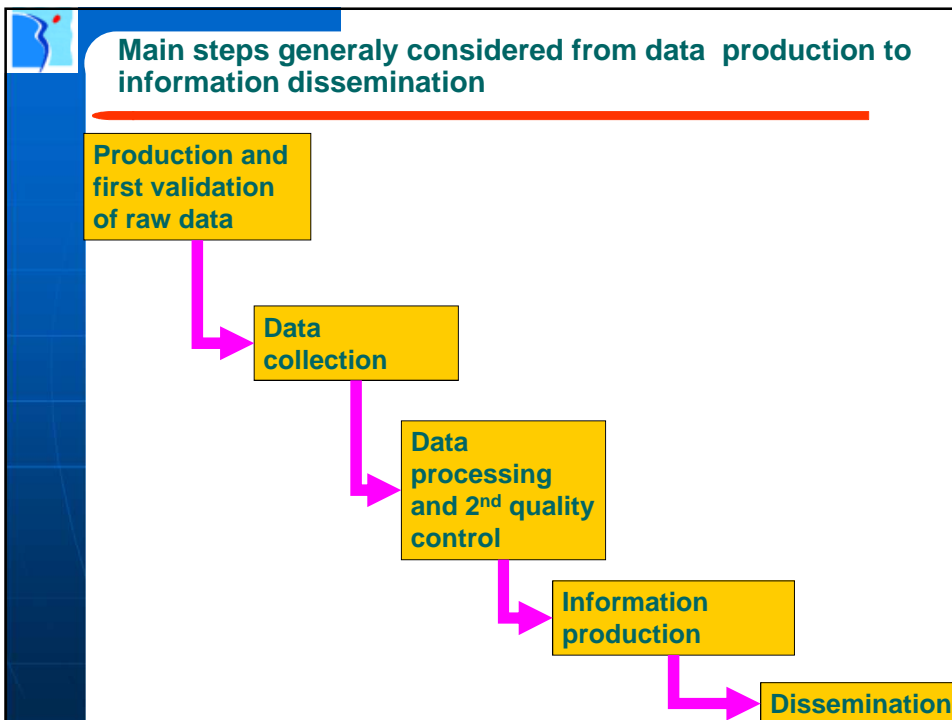

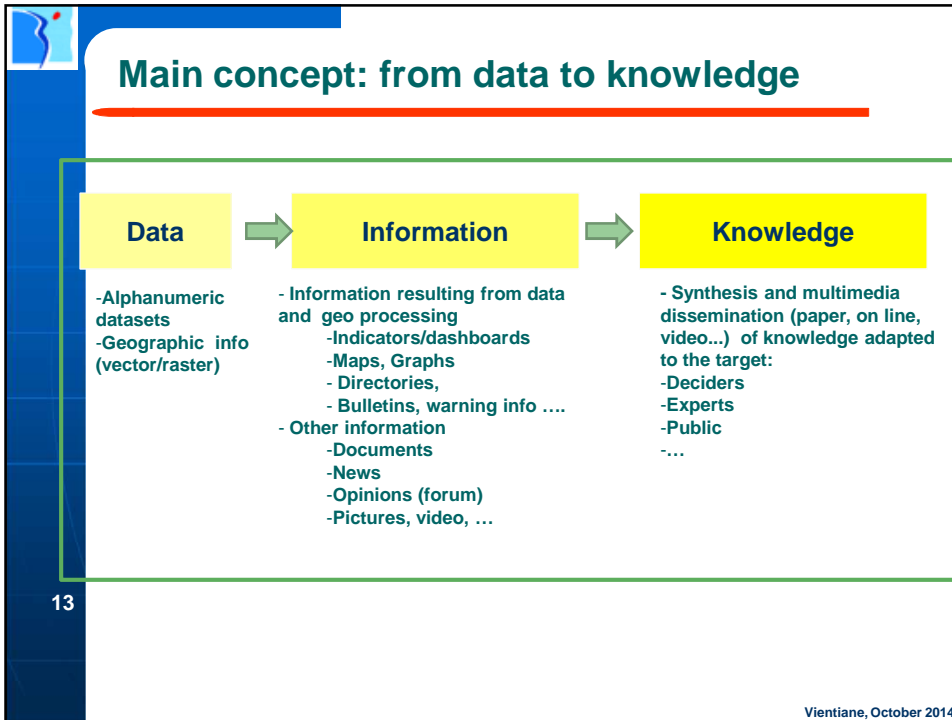

Vientiane, October 2014

8

- ### Countries and MRC are invited to present
- 1/ A global indication on how is organized water data management at national level and basin level
  - 2/ Your experience on the organization of the data collection for the basin characterization;
  - 3/ A presentation of some example hydrological bulletin produced in Vietnam (daily or monthly bulletin on rain, hydrology....) whatever at national or local level.
- 12
- Vientiane, October 2014

## Study case of the French Water information system

“Applying the principle of free and public access to water related data and organizing the institutional links/interoperability of systems and data exchanges procedures between national and local organizations”

<http://www.eaufrance.fr/>

15

Vientiane, October 2014

## Administrative organization of the water management sector in France

22 regions /100 departments/  
more than 36000 municipalities

6 basin agencies

16

Vientiane, October 2014

## Portal of the French national Water Information system

**Access to data and information per basin**

**Access to specific information: i.e; hydrological bulletin**

**Access to data per topic through online national thematic databases**

## ГИДРОЛОГИЧЕСКИЙ БЮЛЛЕТЕНЬ

### ПО РЕКЕ СЫРДАРЬЯ

Бюллетень № 1, октябрь 2011 г.  
(проект)

## HYDROLOGICAL BULLETIN

### ON THE SYRDARYA RIVER

(draft version)

Bulletin n°1 - October 2011

**СОДЕРЖАНИЕ**

ПРЕДИСЛОВИЕ

I. ОБЩЕЕ СОСТОЯНИЕ

II. РЕКА НАРЫН И ТОНКОГУЛЬСКОЕ ВОДОХРАНИЛИЩЕ

III. РЕКА КАРДАРЬЯ И АН ВОДОХРАНИЛИЩЕ

IV. СРЕДНЯЯ ЧАСТЬ РЕКИ С ВОДОХРАНИЛИЩЕ

V. ШАРДАРИНСКОЕ ВОДОХРАНИЛИЩЕ

ЧАСТЬ РЕКИ СЫРДАРЬЯ

**I. ОБЩЕЕ СОСТОЯНИЕ**

После исключительно изобильного 2010 года, в бассейне водохранилища Токтогульского водохранилища, Байрамгольского, Баян-Аулиевогского водохранилищных комплексов, ввиду чрезвычайных условий, таких как: вода в водохранилищах снизилась.

В весенне-летний период 2011 года в зоне формирования речного стока отмечалось маловодье, которое существенно повлияло на режим работы основных водохранилищ и водозаборные объекты в бассейне реки Сырдарья.

Наиболее критической водозаборная ситуация сложилась в нижнем течении реки Сырдарья - приток воды в Шардаринское водохранилище был самым низким за весь ряд наблюдений. Приток воды в Мангыт-Арал был низким.

Расположение гидропостов указано на рисунке 1.

**I. GENERAL TRENDS**

After exceptionally high water availability in 2010 the major water reservoirs (Toktogul, Aydybul, and Bayramgolsk) were filled up and water level was higher than the average annual indicators. Such reserves of water mitigated risks related to water management situation in the upstream and midstream of Syrdarya river.

During the spring and summer of 2011, water scarcity was observed in the area of river water formation. This significantly affected the regime of work of major water reservoirs and water management in the basin of Syrdarya river.

The most critical situation in water management was observed in the lower part of Syrdarya river - inflow to Shardarya water reservoir was the lowest for the entire series of observations, and inflow to Small Aral sea was very low.

Location of stations included is shown in the map below.

Рис. 1. Расположение гидропостов, включенных в первый проект бюллетеня

Location of stations for the first Syrdarya bulletin prototype

**II. РЕКА НАРЫН И ТОНКОГУЛЬСКОЕ ВОДОХРАНИЛИЩЕ**

Пик половодья на реке Нарын наблюдался в конце июня. С июля шло плавное снижение водности реки с 970 до 20 м³/с к концу сентября. В период октябрь-ноябрь водность реки Нарын была ниже среднелетних значений.

Сброс воды из Токтогульского водохранилища начался до середины августа, в среднем сброс воды был снижен до 100-200 м³/с, что меньше среднелетних значений.

Продолжилось постепенное наполнение водохранилища до проектного объема (18500 млн.м³).

На основании анализа гидрометеорологической ситуации притока воды в Токтогульское водохранилище в вегетационный период 2011 г. в I кв. 2011 г. ожидается 155%, в II кв. 2011 г. - 152%, в III кв. 2011 г. - 157%, в IV кв. 2011 г. - 157%.

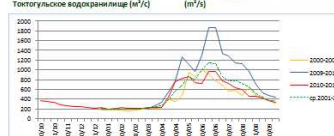

**II. NARYN RIVER AND TOKTOGUL WATER RESERVOIR**

The peak of water overflow in Naryn river was observed in the end of June 2011. From July the runoff started to decrease and in the end of September reached from 970 to 20 m³/s. During the period of July-September the water runoff in Naryn river was lower than the average annual indicators.

The outflow from Toktogul reservoir was increasing gradually during June and mid of August and reached the level higher than the average annual indicators. The outflow was reduced up to 100-200 m³/s, which is lower than the average annual indicators.

The reservoir was filling up gradually reaching the projected volume (18500 Mm³).

Based on the analysis of hydro-meteorological situation the inflow to the Toktogul reservoir in the non-vegetation period 2011-2012 is expected 155% in I quarter 2011-2012, 152% in II quarter 2011-2012, 157% in III quarter 2011-2012, 157% in IV quarter 2011-2012.

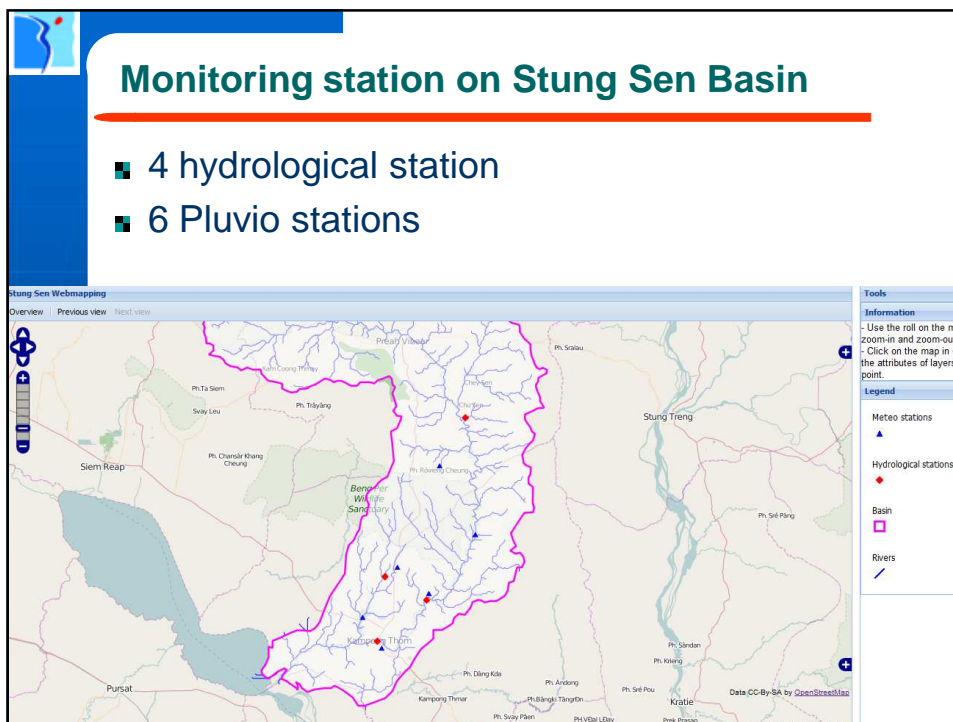

КК16936 р. Нарын - приток в Токтогульское водохранилище (м³/с)

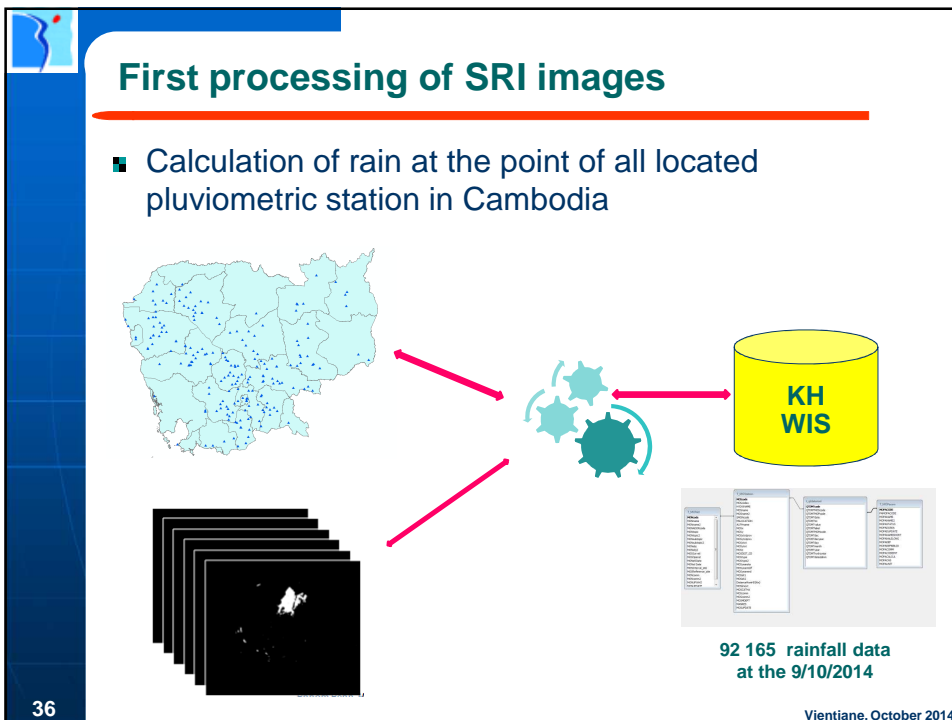

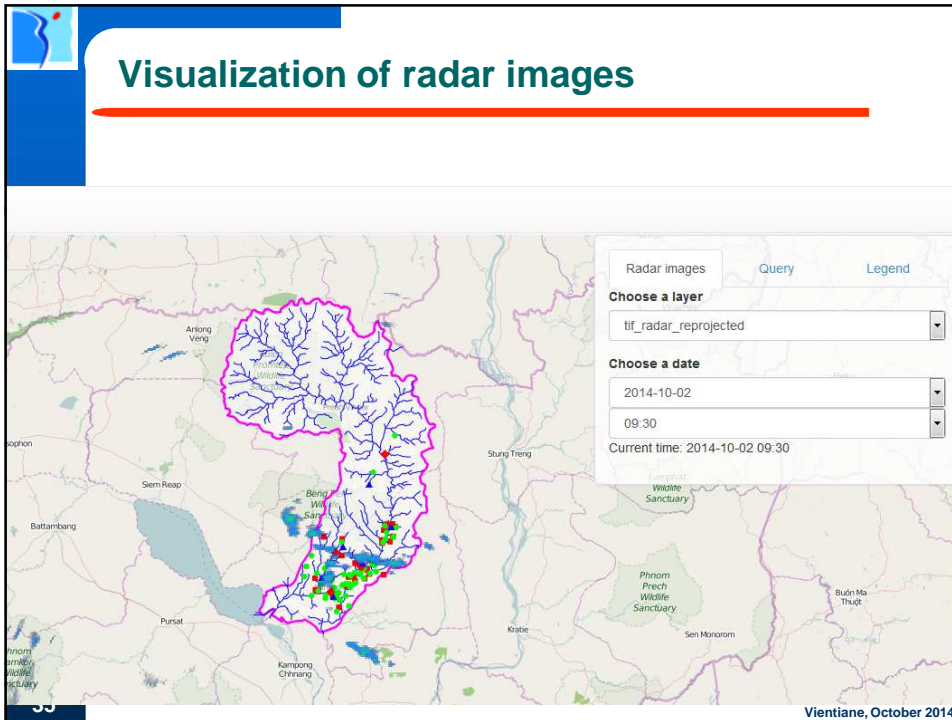

КК16936 (Naryn) River - inflow to Toktogul (m³/s)
